

Assignment 6

Ques: Complete the below task:

1. Explain the below AWS Architecture
2. Implement the same in the AWS (only do a proper connection between service)

Explanation:

Here we need to do load balancing , so to implement load balancing we need to have at least two instances, and then only we will be able to verify whether load is distributed or not (accessing it through the ALB DNS name).

Following the completion of the preceding steps, we must connect one of our load-balanced instances to the RDS service.

Implementation:

First of all, we have to launch two Linux instances.

Instances (2) Info

Find instance by attribute or tag (case-sensitive)

Instance state = running X Clear filters

<input type="checkbox"/>	Name	Instance ID	Instance state	Instance type	Status check	Alarm status	Availability Zone
<input type="checkbox"/>	A	i-047992868a632d029	Running	t2.micro	2/2 checks passed	No alarms +	ap-south-1a
<input type="checkbox"/>	B	i-05714d8ef46eb76d0	Running	t2.micro	2/2 checks passed	No alarms +	ap-south-1a

Now we need to load balance, so we will use ALB for that. Now we know in ALB we need to have a target group, so basically we will be using these two instances (A and B) in the target group. Our target group is referred to here as "first TG."

Create Load Balancer Actions

After doing all the above steps, we need to access our ALB using its DNS name to check if it is load balancing or not.

After associating one of the instances with RDS (MySQL) in free tier settings, AWS maintains these two security groups (ec2-rds-1 and rds-ec2-1) so that we can access our database without having to configure anything.

	Name	Security group ID	Security group name	VPC ID	Description	Owner

To check if connection is done properly or not we need access our DB from the attached instance (here instance A) . To do so first need install mysql on our instance:

command to install mysql is : **sudo yum install mysql**

To check version : **mysql --version**

To check connectivity: **mysql -h <database endpoint> -u < mater username> -p**

hit enter and then type your password

After following all above steps if we see below screen then our connection is done properly.
